The Virtual Learning Environment for Computer Programming

Arbre de mides X56129_ca

Implementeu una funció **RECURSIVA** que, donat un arbre binari d'enters, retorna un nou arbre amb la mateixa estructura, i a on cada posició conté el nombre total de nodes del subarbre que penja d'aquella mateixa posició a l'arbre inicial. Aquesta és la capcelera:

```
// Pre:
// Post: Retorna un arbre d'enters amb la mateixa estructura que t,
// i a on cada subarbre té com a valor a l'arrel el nombre de nodes
// del corresponent subarbre a t.
BinTree<int> treeOfSizes(BinTree<int> t);
```

Aquí tenim un exemple de paràmetre d'entrada de la funció i la corresponent sortida:

Fixeu-vos que l'enunciat d'aquest exercici ja ofereix uns fitxers que haureu d'utilitzar per a compilar: main.cc, BinaryTree.hh, treeOfSizes.hh. Us falta crear el fitxer treeOfSizes.cc amb els corresponents includes i implementar-hi la funció anterior. Només cal que pugeu treeOfSizes.cc al jutge.

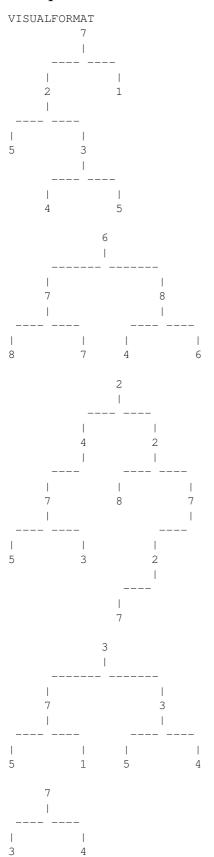

Entrada

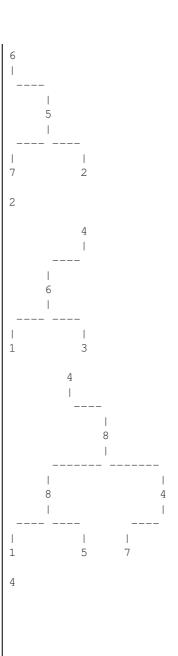

La primera linia de l'entrada descriu el format en el que es descriuen els arbres, o bé IN-LINEFORMAT o bé VISUALFORMAT. Després venen un nombre arbitrari de casos. Cada cas consisteix en una descripció d'un arbre un arbre binari d'enters. Fixeu-vos en que el programa que us oferim ja s'encarrega de llegir aquestes entrades. Només cal que implementeu la funció abans esmentada.

Sortida

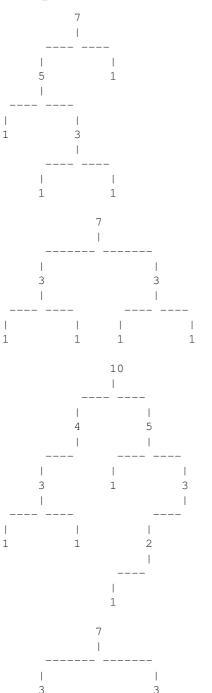

Per a cada cas, la sortida conté el corresponent arbre de mides. Fixeu-vos en que el programa que us oferim ja s'encarrega d'escriure aquesta sortida. Només cal que implementeu la funció abans esmentada.

```

Observació

La vostra funció i subfuncions que creeu han de treballar només amb arbres. Heu de trobar una solució **RECURSIVA** del problema.
